

## Set of two high competition volleyball posts protections

PY020

Set of two high competition volleyball posts protections made of an internal padding de polyurethane foam density D-25. It has been made by a polyurethane block casting in the rough "Monoblock" without glue inside, ensuring the absence of internal cracks, making it more compact. The shape is oval, thicker padding being in delicate areas (cable and net attachment points where the handle is inserted).

There are no sharp edges or hard areas . Its external cover is made of high tenacity polyester fabric covered with PVC on both sides. Double stitching on the inside of the cover so that the outer face has not hard edges. Made from one single piece of fabric for the main body and two end pieces (top and bottom). High resistance fibre zip-fastener for emptying-filling, on the inner face (looking towards the post).

Flaps with Velcro safety fastening in the court area leaving the space required for cables, net, etc. The final result is a compact product with no seams, Velcro attachments, zip-fasteners or other elements which would hinder its protective function, on its useful surface.
