

FAST BREAK SYSTEM

THE FASTEST WAY TO PLAY ON WOOD.

THE FAST BREAK SYSTEM IS AN AREA ELASTIC WOOD FLOORING SYSTEM. THE PATENTED DETACHABLE PLATES CAN BE COMBINED MODULARLY WITH AN ELASTIC MAT SUBLAYER.

FIBA LEVEL 1 TYPE-APPROVED, THE SYSTEM COMPRISES A LOAD-BEARING LAYER OF BIRCH PHENOLIC MARINE PLYWOOD WITH A HARDWOOD SURFACE LAYER IN OAK, ASH, OR BIRCH.

Optimal ball bounce, proper grip between shoes and the court when players quickly change direction, and balanced elasticity when players jump make the Fast Break System ideal for high-level basketball games.

QUICK TO ASSEMBLE, EASY TO CUSTOMIZE.

To guarantee a perfect joint between the panels, the interlocking system incorporates special closeable handles and metal strips, which ensure perfect floor traction, a perfectly flat surface, and perfect elastic response.

The interlocking system with closeable handles does not require special tools for assembly, and it allows the overall size of the floor to be reduced, which makes handling and logistics easier. The result is a sport floor simple and quick to assemble: [watch the video here!](#)

The plates can be supplied in metal cages that can be disassembled for transportation and storage.

The panels located along the perimeter come with interconnections that are externally reinforced and shaped with a sloping edge. As a result, the Fast Break System does not require additional external perimeters.

The perimeter panels' slope and colors can be customized, and logos can be added as well.

HIGH-LEVEL BASKETBALL.

The Fast Break System is an ideal system for top national and international competitions. It complies with the European Standard EN 14904 requirements and is approved by FIBA (FIBA Certificate of Approval for Wooden Flooring Category, Level 1, 2 and 3) for high-level basketball competitions.
